

# NP, coNP and the Nullstellensatz: Lower Bounds for Stable Set and Graph Coloring Nullstellensätze

Susan Margulies (UC Davis), J. De Loera (UC Davis), J. Lee (IBM), and S. Onn (Techion)

## 1 Key Points

Systems of polynomial equations over the complex numbers can be used to characterize NP-Complete graph-theoretic decision problems. From the point of view of computer algebra and symbolic computation, these are interesting polynomial systems because they are provably hard: solving them is as hard as solving the underlying NP-Complete problem. Furthermore, unless NP = coNP, there must exist infinite instances of these infeasible systems whose Hilbert Nullstellensatz certificates grow with respect to the underlying graphs.

## 2 Stable Set as a Zero-Dimensional System of Polynomial Equations (L. Lovász)

Given a graph  $G$  and an integer  $k$ , we construct the following equations:

- For every vertex  $i = 1, \dots, n$ , let  $x_i^2 - x_i = 0$
- For every edge  $(i, j) \in E(G)$ , let  $x_i x_j = 0$
- Finally, let

$$\left(-k + \sum_{i=1}^n x_i\right) = 0$$

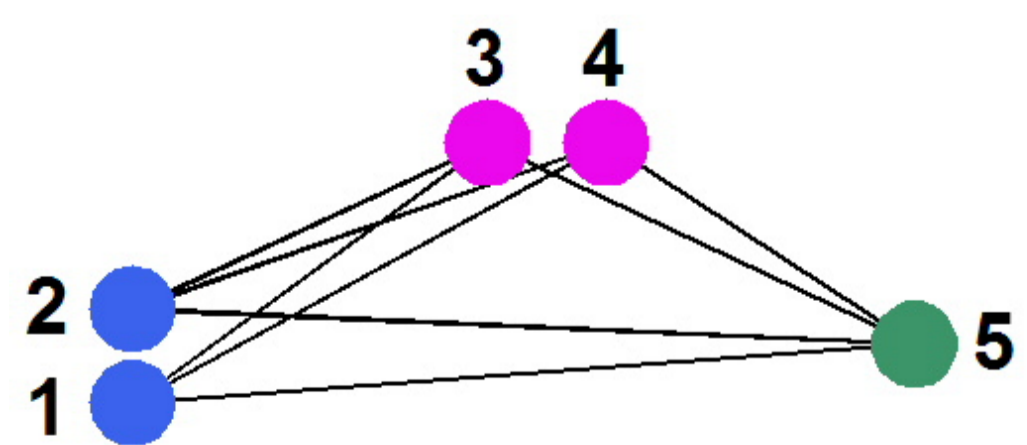

- **Theorem:** Let  $G$  be a graph,  $k$  an integer, encoded as the above  $(n + m + 1)$  zero-dimensional system of equations. Then this system has a solution if and only if  $G$  has an independent set of size  $k$ .

## 3 Stable Set Nullstellensätze

**Theorem 3.1** Given a graph  $G$ , there exists a Nullstellensatz certificate of degree  $\alpha(G)$  that certifies the non-existence of a stable set of size  $(\alpha(G) + r)$ . Moreover, there exist families of graphs for which the minimum degree possible is at least  $\alpha(G)/2$ .

**Corollary 3.2** Given a graph  $G$ , there exists a Nullstellensatz certificate of degree  $\alpha(G)$  certifying the non-existence of a stable set of size  $(\alpha(G) + r)$ , where all of the terms in every coefficient is a monomial corresponding to an independent set, and the coefficient for the stable set polynomial contains every independent set.

## 4 Turán Graph $T(5, 3)$ Nullstellensatz

$$1 = \left(\frac{x_1 x_2 + x_3 x_4}{12} - \frac{x_1 + x_3 + x_5 + x_2 + x_4}{12} - \frac{1}{4}\right)(x_1 + x_3 + x_5 + x_2 + x_4 - 4) + \left(\frac{x_4}{12} + \frac{x_2}{12} + \frac{1}{6}\right)x_1 x_3 + \left(\frac{x_2}{12} + \frac{1}{6}\right)x_1 x_4 + \left(\frac{x_2}{12} + \frac{1}{6}\right)x_1 x_5 + \left(\frac{x_4}{12} + \frac{1}{6}\right)x_2 x_3 + \frac{x_2 x_4}{6} + \frac{x_2 x_5}{6} + \left(\frac{x_4}{12} + \frac{1}{6}\right)x_3 x_5 + \frac{x_4 x_5}{6} + \left(\frac{x_2}{12} + \frac{1}{12}\right)(x_1^2 - x_1) + \left(\frac{x_1}{12} + \frac{1}{12}\right)(x_2^2 - x_2) + \left(\frac{x_4}{12} + \frac{1}{12}\right)(x_3^2 - x_3) + \left(\frac{x_3}{12} + \frac{1}{12}\right)(x_4^2 - x_4) + \frac{x_5^2 - x_5}{12}$$

## 5 Experimental Results for Minimum-Degree Stable Set Nullstellensätze

Graph	vertices	edges	$\alpha(G)$	$\deg(\alpha)$	Graph	vertices	edges	$\alpha(G)$	$\deg(\alpha)$
$P_3$	3	2	2	2	$C_3$	3	3	1	1
$P_5$	5	4	3	3	$C_5$	5	5	2	2
$P_{10}$	10	9	5	5	$C_{10}$	10	10	5	5
$T(5, 2)$	5	6	3	3	$T(3, 1)$	3	3	1	1
$T(5, 3)$	5	8	2	2	$T(6, 2)$	6	6	2	2
$T(6, 2)$	6	9	3	3	$T(9, 3)$	9	9	3	3
$T(6, 3)$	6	12	2	2	$T(12, 4)$	12	12	4	4
$T(7, 2)$	7	12	4	4	$T(8, 2)$	8	8	2	2
$T(8, 2)$	8	16	4	4	$T(12, 3)$	12	12	3	3

## 6 NP, coNP and the Nullstellensatz

**Theorem 6.1** If  $NP \neq coNP$ , then there must exist an infinite family of graphs such that the minimum-degree Nullstellensatz for not- $k$ -colorability or non-existence of a stable set of size  $k$  grows with respect to the size of the graph.

## 7 Graph Coloring as a Zero-Dimensional System of Polynomial Equations (D. Bayer)

Given a graph  $G$  and an integer  $k$ , we construct the following equations:

- **vertex polynomials:** For every vertex  $i = 1, \dots, n$ ,

$$x_i^k - 1 = 0$$

- **edge polynomials:** For every edge  $(i, j) \in E(G)$ ,

$$\frac{x_i^k - x_j^k}{x_i - x_j} = x_i^{k-1} + x_i^{k-2} x_j + \dots + x_i x_j^{k-2} + x_j^{k-1} = 0$$

- **Theorem:** Let  $G$  be a graph,  $k$  an integer, encoded as vertex and edge polynomials. Then this system of equations has a solution if and only if  $G$  is  $k$ -colorable.

## 8 Odd Wheels, Cat Ears, Cliques and not-3-colorable Nullstellensätze

**Theorem 8.1** The minimum degree Nullstellensatz for odd-wheels is four.

**Proof Sketch:**

We derive a certificate for the  $(n + 1)$ -odd wheel from the  $n$ -th odd wheel, by taking a very particular syzygy on some of the terms from the  $n$ -th odd wheel not 3-colorable certificate.

**Theorem 8.2** The minimum degree Nullstellensatz for any cat ears graph is four.

**Theorem 8.3** The minimum degree Nullstellensatz for  $K_n$ ,  $n \geq 4$  is four.

**Theorem 8.4** The minimum degree Nullstellensatz for any graph is four.

## 9 Experimental Results for Minimum-Degree Graph Coloring Nullstellensätze

Kneser graphs, Mycielski graphs, Queen graphs, uniquely-colorable graphs, Mycielski graphs of Mycielski graphs, flowers, assorted triangle-free graphs, Vega graphs, all graphs in six vertices are less.

## 10 Other Encodings: Hamiltonian Cycle as a Zero-Dimensional System of Polynomial Equations

- For every vertex  $i = 1, \dots, n$ , we have two equations:

$$\prod_{s=1}^n (x_i - s) = 0, \quad \text{and} \quad \prod_{(i,j) \in E(G)} (x_i - x_j + 1)(x_i - x_j - (n - 1)) = 0$$

- **Theorem:** A graph  $G$  has a hamiltonian cycle if and only if the above zero-dimensional system of  $2n$  equations has a solution.

- **Other Encodings:** Longest cycle, graph planarity, max cut and more!

## 11 Searching for Hilbert Nullstellensatz degrees...

**Nullstellensatz:** If  $V(\langle f_1, \dots, f_s \rangle) = \emptyset$ , then  $1 = \sum_{i=1}^s \alpha_i f_i$

$$1 = (c_1 x + c_2 y + c_3 z + c_4 w + c_5)(x^3 - 1) + (c_6 x + c_7 y + c_8 z + c_9 w + c_{10})(y^3 - 1) + (c_{11} x + \dots + c_{15})(z^3 - 1) + (c_{16} x + \dots + c_{20})(w^3 - 1) + (c_{21} x + \dots + c_{25})(x^2 + xy + y^2) + (c_{26} x + \dots + c_{30})(x^2 + xz + z^2) + (c_{31} x + \dots + c_{35})(x^2 + xw + w^2) + (c_{36} x + \dots + c_{40})(y^2 + yz + z^2) + (c_{41} x + \dots + c_{45})(y^2 + yw + w^2) + (c_{46} x + \dots + c_{50})(z^2 + zw + w^2)$$

Try a degree for the  $\alpha$  polynomials, and construct a large-scale sparse linear system of equations. If infeasible, try a larger degree for  $\alpha$ . Note:  $\deg \alpha$  cannot exceed known upper bounds for Hilbert Nullstellensatz.
