**CATEGORY 4 - COMPUTERS**

**Note 1:** Computers, related equipment and "software" performing telecommunications or "local area network" functions must also be evaluated against the performance characteristics of Category 5, Part 1 (Telecommunications).

**Note 2:** Control units that directly interconnect the buses or channels of central processing units, "main storage" or disk controllers are not regarded as telecommunications equipment described in Category 5, Part 1 (Telecommunications).

**N.B:** For the control status of "software" specially designed for packet switching, see ECCN 5D001. (Telecommunications).

**Note 3:** Computers, related equipment and "software" performing cryptographic, cryptoanalytic, certifiable multi-level security or certifiable user isolation functions, or that limit electromagnetic compatibility (EMC), must also be evaluated against the performance characteristics in Category 5, Part 2 ("Information Security").

**A. SYSTEMS, EQUIPMENT AND COMPONENTS**

4A001 Electronic computers and related equipment, and "electronic assemblies" and specially designed components therefor.

**License Requirements**

*Reason for Control:* NS, MT, AT, NP, XP

*Control(s) Country Chart*

NS applies to entire entry NS Column 2

MT applies to items in 4A001.a when the parameters in 4A101 are met or exceeded

AT applies to entire entry AT Column 1

NP applies to electronic computers with a CTP greater than 6,500 Mtops, unless a License Exception is available. See §742.3(b) of the EAR for information on applicable licensing review policies.

XP applies to electronic computers with a CTP greater than 6,500 Mtops, unless a License Exception is available. XP controls vary according to destination and end-user and end-use. See §742.12 of the EAR for additional information.

**License Requirement Notes:** See §743.1 of the EAR for reporting requirements for exports under License Exceptions.

**License Exceptions**

- **LVS:** $5000 for 4A001.a; N/A for MT and 4A001.b
- **GBS:** N/A
- **CIV:** N/A

**List of Items Controlled**

*Unit:* Equipment in number; parts and accessories in $ value

*Related Controls:* See also 4A101 and 4A994. Equipment designed or rated for transient ionizing radiation is subject to the export licensing authority of the U.S. Department of State, Office of Defense Trade Controls. (See 22 CFR part 121.) See also 4A101.

*Related Definitions:* For the purposes of integrated circuits in 4A001.a, 2, 5 x 10^3 Gy(Si) = 5 x 10^3 Rads (Si); 5 x 10^6 Gy (Si)/s = 5 x 10^8 Rads (Si)/s.

*Items:*

a. Specially designed to have either of the
following characteristics:

a.1. Rated for operation at an ambient temperature below 228 K (-45° C) or above 358 K (85° C);

Note: 4A001.a.1. does not apply to computers specially designed for civil automobile or railway train applications.

a.2. Radiation hardened to exceed any of the following specifications:

a.2.a. A total dose of $5 \times 10^3$ Gy (Si); or

a.2.b. A dose rate upset of $5 \times 10^6$ Gy (Si)/s;

a.2.c. Single Event Upset of $1 \times 10^{-7}$ Error/bit/day;

b. Having characteristics or performing functions exceeding the limits in Category 5, Part 2 ("Information Security").

4A002 "Hybrid computers" and "electronic assemblies" and specially designed components therefor.

License Requirements

Reason for Control: NS, MT, AT, NP, XP

Control(s) Country Chart

NS applies to entire entry NS Column 2

MT applies to hybrid MT Column 1

computers combined with specially designed "software", for modeling, simulation, or design integration of complete rocket systems and

Unmanned air vehicle systems that are usable in systems

Controlled for MT reasons

AT applies to entire entry AT Column 1

NP applies to hybrid computers with a CTP greater than 6,500 Mtops, unless a License Exception is available. See §742.3(b) of the EAR for information on applicable licensing review policies.

XP applies to hybrid computers with a CTP greater than 6,500 Mtops, unless a License Exception is available. XP controls vary according to destination and end-user and end-use. See §742.12 of the EAR for additional information.

License Exceptions

LVS: $5000; N/A for MT

GBS: N/A

CIV: N/A

List of Items Controlled

Unit: Equipment in number; parts and accessories in $ value

Related Controls: See also 4A102 and 4A994

Related Definitions: N/A

Items:

a. Containing "digital computers" controlled by 4A003;

b. Containing analog-to-digital converters having all of the following characteristics:

   b.1. 32 channels or more; and

   b.2. A resolution of 14 bits (plus sign bit) or more with a conversion rate of 200,000 conversions/s or more.

4A003 "Digital computers", "electronic assemblies", and related equipment therefor, and specially designed components therefor.
License Requirements

Reason for Control: NS, MT, CC, AT, NP, XP

Control(s) Country Chart
NS applies to 4A003.b and .c NS Column 1
NS applies to 4A003.a, d, .e, and .g NS Column 2
MT applies to digital MT Column 1
computers used as ancillary equipment for test facilities and equipment that are controlled by 9B005 or 9B006.
CC applies to digital computers CC Column 1 for computerized finger-print equipment
AT applies to entire entry AT Column 1 (refer to 4A994 for controls on digital computers with a CTP 6 but to 6,500 MTOPS)
NP applies to digital computers with a CTP greater than 6,500 MTOPS, unless a License Exception is available. See §742.3(b) of the EAR for information on applicable licensing review policies.
XP applies to digital computers with a CTP greater than 6,500 MTOPS, unless a License Exception is available. XP controls vary according to destination and end-user and end-use. See §742.12 of the EAR for additional information.

License Requirement Notes: See §743.1 of the EAR for reporting requirements for exports under License Exceptions.

License Exceptions

LVS: $5000; N/A for MT "digital" computers controlled by 4A003.b and having a CTP exceeding 12,500 MTOPS; or "electronic assemblies" controlled by 4A003.c and capable of enhancing performance by aggregation of "computing elements" so that the CTP of the aggregation exceeds 12,500 MTOPS.

GBS: Yes, for 4A003.d, .e, and .g and specially designed components therefor, exported separately or as part of a system.

CTP: Yes, for computers controlled by 4A003.a, b and .c, to the exclusion of other technical parameters, with the exception of parameters specified as controlled for Missile Technology (MT) concerns and 4A003.e (equipment performing analog-to-digital or digital-to-analog conversions exceeding the limits of 3A001.a.5.a). See §740.7 of the EAR.

CIV: Yes, for .e, and .g.

List of Items Controlled

Unit: Equipment in number; parts and accessories in $ value
Related Controls: See also 4A994 and 4A980
Related Definitions: N/A
Items:
Note 1: 4A003 includes the following:

- a. Vector processors;
- b. Array processors;
- c. Digital signal processors;
- d. Logic processors;
- e. Equipment designed for "image enhancement";
- f. Equipment designed for "signal processing".

Note 2: The control status of the "digital computers" and related equipment described in 4A003 is determined by the control status of other equipment or systems provided:

- a. The "digital computers" or related equipment are essential for the operation of the other equipment or systems;
- b. The "digital computers" or related equipment are not a "principal element" of the other equipment or systems; and

N.B. 1: The control status of "signal processing" or "image enhancement" equipment specially designed for other equipment with functions limited to those required for the other equipment is determined by the control status of the other equipment even if it exceeds the "principal element" criterion.

N.B. 2: For the control status of "digital computers" or related equipment for telecommunications equipment, see Category 5, Part 1 (Telecommunications).

c. The "technology" for the "digital computers" and related equipment is determined by 4E.

- a. Designed or modified for "fault tolerance";

Note: For the purposes of 4A003.a., "digital computers" and related equipment are not considered to be designed or modified for "fault tolerance" if they utilize any of the following:

1. Error detection or correction algorithms in "main storage";

2. The interconnection of two "digital computers" so that, if the active central processing unit fails, an idling but mirroring central processing unit can continue the system's functioning;

3. The interconnection of two central processing units by data channels or by use of shared storage to permit one central processing unit to perform other work until the second central processing unit fails, at which time the first central processing unit takes over in order to continue the system's functioning; or

4. The synchronization of two central processing units by "software" so that one central processing unit recognizes when the other central processing unit fails and recovers tasks from the failing unit.

b. "Digital computers" having a "composite theoretical performance" ("CTP") exceeding 6,500 million theoretical operations per second (MTOPS);

c. "Electronic assemblies" specially designed or modified to be capable of enhancing performance by aggregation of "computing elements" ("CEs") so that the "CTP" of the aggregation exceeds the limit in 4A003.b.;

Note 1: 4A003.c applies only to "electronic assemblies" and programmable interconnections not exceeding the limit in 4A003.b. when shipped as unintegrated "electronic assemblies". It does not apply to "electronic assemblies" inherently limited by nature of their design for use as related equipment controlled by 4A003.d, or 4A003.e
**Commercial Control List Supplement No. 1 to Part 774 Category 4 Page 5**

**Note 2:** 4A003.c does not control "electronic assemblies" specially designed for a product or family of products whose maximum configuration does not exceed the limit of 4A003.b.

d. Graphics accelerators and graphics coprocessors exceeding a "three dimensional Vector Rate" of 200,000,000;

e. Equipment performing analog-to-digital conversions exceeding the limits in 3A001.a.5;

f. Reserved.

g. Equipment specially designed to provide external interconnection of "digital computers" or associated equipment that allows communications at data rates exceeding 1.25 Gbyte/s.

**Note:** 4A003.g does not control internal interconnection equipment (e.g., backplanes, buses) passive interconnection equipment, "network access controllers" or "communication channel controllers".

### 4A004 Computers, as follows (see List of Items Controlled) and specially designed related equipment, "electronic assemblies" and components therefor.

List of Items Controlled

Unit: Equipment in number; parts and accessories in $ value
Related Controls: N/A
Related Definitions: "Two dimensional vector rate" is the number vectors generated per second that have 10 pixel poly line vectors, clip tested, randomly oriented, with either integer or floating point X-Y coordinate values (whichever produces the maximum rate) (see paragraph (g) of this ECCN).
Items:

a. Electronic computers and related equipment, and "electronic assemblies" and specially designed components therefor, rated for operation at an ambient temperature above 343 K (70 °C);

b. "Digital computers" having a "composite theoretical performance" ("CTP") equal to or greater than 6 million theoretical operations per second (MTOPS);

c. "Electronic assemblies" that are specially designed or modified to enhance performance by aggregation of "computing elements" ("CEs"), as follows:

c.1. Designed to be capable of aggregation in
configurations of 16 or more "computing elements" ("CEs"); or

c.2. Having a sum of maximum data rates on all channels available for connection to associated processors exceeding 40 million Byte/s;

Note 1: 4A994.c applies only to "electronic assemblies" and programmable interconnections with a "CTP" not exceeding the limits in 4A994.b, when shipped as unintegrated "electronic assemblies". It does not apply to "electronic assemblies" inherently limited by nature of their design for use as related equipment controlled by 4A994.

Note 2: 4A994.c does not control any "electronic assembly" specially designed for a product or family of products whose maximum configuration does not exceed the limits of 4A994.b.

d. Disk drives and solid state storage equipment:

d.1. Magnetic, erasable optical or magneto-optical disk drives with a "maximum bit transfer rate" exceeding 25 million bit/s;

d.2. Solid state storage equipment, other than "main storage" (also known as solid state disks or RAM disks), with a "maximum bit transfer rate" exceeding 36 million bit/s;

e. Input/output control units designed for use with equipment controlled by 4A994.d;

f. Equipment for "signal processing" or "image enhancement" having a "composite theoretical performance" ("CTP") exceeding 8.5 million theoretical operations per second (MTOPS);

g. Graphics accelerators or graphics coprocessors that exceed a "three dimensional vector rate" of 400,000 or, if supported by 2-D vectors only, a "two dimensional vector rate" of 600,000;

Note: The provisions of 4A994.g do not apply to work stations designed for and limited to:

a. Graphic arts (e.g., printing, publishing); and

b. The display of two-dimensional vectors.

h. Color displays or monitors having more than 120 resolvable elements per cm in the direction of the maximum pixel density;

Note 1: 4A994.h does not control displays or monitors not specially designed for electronic computers.

Note 2: Displays specially designed for air traffic control (ATC) systems are treated as specially designed components for ATC systems under Category 6.

i. Equipment containing "terminal interface equipment" exceeding the limits in 5A991.

Note: For the purposes of 4A994.i, "terminal interface equipment" includes "local area network" interfaces, modems and other communications interfaces. "Local area network" interfaces are evaluated as "network access controllers".

j. Equipment specially designed to provide external interconnection of "digital computers" or associated equipment that allows communications at data rates exceeding 80 Mbyte/s.

Note: 4A994.j does not control internal interconnection equipment (e.g., backplanes, buses) passive interconnection equipment, "network access controllers" or "communication channel controllers".

B. TEST, INSPECTION AND PRODUCTION EQUIPMENT

4B994 Equipment for the "development" and "production" of magnetic and optical storage
equipment.

Information on How to Calculate "Composite Theoretical Performance ("CTP")"

**Technical Note:**

"COMPOSITE THEORETICAL PERFORMANCE" ("CTP")

Abbreviations used in this Technical Note

"CE" "computing element" (typically an arithmetic logical unit)
FP floating point
XP fixed point
t execution time
XOR exclusive OR
CPU central processing unit
TP theoretical performance (of a single "CE")
"CTP" "composite theoretical performance" (multiple "CEs")
R effective calculating rate
WL word length
L word length adjustment
* multiply

Execution time t is expressed in microseconds, TP and "CTP" are expressed in millions of theoretical operations per second (Mtops) and WL is expressed in bits.

Outline of "CTP" calculation method

"CTP" is a measure of computational performance given in Mtops. In calculating the "CTP" of an aggregation of "CEs" the following three steps are required:

1. Calculate the effective calculating rate R for each "CE";

2. Apply the word length adjustment (L) to the effective calculating rate (R), resulting in a
Theoretical Performance (TP) for each "CE";

3. If there is more than one "CE", combine the TPs, resulting in a "CTP" for the aggregation. Details for these steps are given in the following sections.

**Note 1:** For aggregations of multiple "CEs" that have both shared and unshared memory subsystems, the calculation of "CTP" is completed hierarchically, in two steps: first, aggregate the groups of "CEs" sharing memory; second, calculate the "CTP" of the groups using the calculation method for multiple "CEs" not sharing memory.

**Note 2:** "CEs" that are limited to input/output and peripheral functions (e.g., disk drive, communication and video display controllers) are not aggregated into the "CTP" calculation.
The following table shows the method of calculating the Effective Calculating Rate $R$ for each "CE":

**Step 1: The effective calculating rate $R$**

### XP only

- **$(R_{xp})$**
  - $1$
  - $\frac{1}{3 \times (txp\text{ add})}$
  - If no add is implemented use:
    - $1$
    - $\frac{1}{txp\text{ mult}}$
  - If neither add nor multiply is implemented use the fastest available arithmetic operation as follows:
    - $1$
    - $\frac{1}{3 \times t_{xp}}$
  - See Notes X & Z

### FP only

- **$(R_{fp})$**
  - $1$
  - $\frac{1}{1}$
  - $\frac{1}{t_{fp\text{ add}}}$, $\frac{1}{t_{fp\text{ mult}}}$
  - See Notes X & Y

### Both FP and XP

- **$(R)$**
  - Calculate both $R_{xp}$, $R_{fp}$

### For simple logic processors not implementing any of the specified arithmetic operations.

- $1$
  - $\frac{1}{3 \times t_{log}}$
  - Where $t_{log}$ is the execute time of the XOR, or for logic hardware not implementing the XOR, the fastest simple logic operation.
  - See Notes X & Z

### For special logic processors not using any of the specified arithmetic or logic operations.

- $R = R' * WL/64$
  - Where $R'$ is the number of results per second, $WL$ is the number of bits upon which the logic operation occurs, and 64 is a factor to normalize to a 64 bit operation.
Note W: For a pipelined "CE" capable of executing up to one arithmetic or logic operation every clock cycle after the pipeline is full, a pipelined rate can be established. The effective calculating rate (R) for such a "CE" is the faster of the pipelined rate or non-pipelined execution rate.

Note X: For a "CE" that performs multiple operations of a specific type in a single cycle (e.g., two additions per cycle or two identical logic operations per cycle), the execution time $t$ is given by:

\[
t = \frac{\text{cycle time}}{\text{the number of identical operations per machine cycle}}
\]

"CEs" that perform different types of arithmetic or logic operations in a single machine cycle are to be treated as multiple separate "CEs" performing simultaneously (e.g., a "CE" performing an addition and a multiplication in one cycle is to be treated as two "CEs", the first performing an addition in one cycle and the second performing a multiplication in one cycle). If a single "CE" has both scalar function and vector function, use the shorter execution time value.

Note Y: For the "CE" that does not implement FP add or FP multiply, but that performs FP divide:

\[
R_{fp} = \frac{1}{t_{fp\text{divide}}}
\]

If the "CE" implements FP reciprocal but not FP add, FP multiply or FP divide, then

\[
R_{fp} = \frac{1}{t_{fp\text{reciprocal}}}
\]

If none of the specified instructions is implemented, the effective FP rate is 0.

Note Z: In simple logic operations, a single instruction performs a single logic manipulation of no more than two operands of given lengths. In complex logic operations, a single instruction performs multiple logic manipulations to produce one or more results from two or more operands.

Rates should be calculated for all supported operand lengths considering both pipelined operations (if supported), and non-pipelined operations using the fastest executing instruction for each operand length based on:

1. Pipelined or register-to-register operations. Exclude extraordinarily short execution times generated for operations on a predetermined operand or operands (for example, multiplication by 0 or 1). If no register-to-register operations are implemented, continue with (2).

2. The faster of register-to-memory or memory-to-register operations; if these also do not exist, then continue with (3).

3. Memory-to-memory.

In each case above, use the shortest execution time certified by the manufacturer.

Step 2: TP for each supported operand length WL

Adjust the effective rate $R$ (or $R'$) by the word length adjustment $L$ as follows:

\[TP = R \times L, \text{ where } L = (1/3 + WL/96)\]

Note: The word length WL used in these calculations is the operand length in bits. (If an operation uses operands of different lengths, select the largest word length.) The combination of a mantissa ALU and an exponent ALU of a floating point processor or unit is considered to be one "CE" with a Word Length (WL) equal to the number of bits in the data representation (typically 32 or 64) for purposes of the "CTP" calculation.
This adjustment is not applied to specialized logic processors that do not use XOR instructions. In this case TP = R.

Select the maximum resulting value of TP for:

- Each XP-only "CE" (R_xp);
- Each FP-only "CE" (R_fp);
- Each combined FP and XP "CE" (R);
- Each simple logic processor not implementing any of the specified arithmetic operations; and
- Each special logic processor not using any of the specified arithmetic or logic operations.

Step 3: "CTP" for aggregations of "CEs", including CPUs.

For a CPU with a single "CE", "CTP" = TP (for "CEs" performing both fixed and floating point operations
TP = max (TP_fp, TP_xp))

"CTP" for aggregations of multiple "CEs" operating simultaneously is calculated as follows:

Note 1: For aggregations that do not allow all of the "CEs" to run simultaneously, the possible combination of "CEs" that provides the largest "CTP" should be used. The TP of each contributing "CE" is to be calculated at its maximum value theoretically possible before the "CTP" of the combination is derived.

N.B.: To determine the possible combinations of simultaneously operating "CEs", generate an instruction sequence that initiates operations in multiple "CEs", beginning with the slowest "CE" (the one needing the largest number of cycles to complete its operation) and ending with the fastest "CE". At each cycle of the sequence, the combination of "CEs" that are in operation during that cycle is a possible combination. The instruction sequence must take into account all hardware and/or architectural constraints on overlapping operations.

Note 2: A single integrated circuit chip or board assembly may contain multiple "CEs".

Note 3: Simultaneous operations are assumed to exist when the computer manufacturer claims concurrent, parallel or simultaneous operation or execution in a manual or brochure for the computer.

Note 4: "CTP" values are not to be aggregated for "CE" combinations (inter)connected by "Local Area Networks", Wide Area Networks, I/O shared connections/devices, I/O controllers and any communication interconnection implemented by "software".

Note 5: "CTP" values must be aggregated for multiple "CEs" specially designed to enhance performance by aggregation, operating simultaneously and sharing memory, or multiple memory/"CE"-combinations operating simultaneously utilizing specially designed hardware.

This aggregation does not apply to "electronic assemblies" described by 4A003.c.

"CTP" = TP_1 + C_2 * TP_2 + ... + C_n * TP_n,

where the TPs are ordered by value, with TP_1 being the highest, TP_2 being the second highest, ..., and TP_n being the lowest. C_i is a coefficient determined by the strength of the interconnection between "CEs", as follows:

For multiple "CEs" operating simultaneously and sharing memory:

C_2 = C_3 = C_4 = ... = C_n = 0.75

Note 1: When the "CTP" calculated by the above method does not exceed 194 Mtops, the following formula may be used to calculate C_i:
$0.75 \ C_i = \frac{---}{m}$

(i = 2, ..., n)

where $m$ = the number of "CEs" or groups of "CEs" sharing access.

provided:

1. The TP$_1$ of each "CE" or group of "CEs" does not exceed 30 Mtops;

2. The "CEs" or groups of "CEs" share access to main memory (excluding cache memory) over a single channel; and

3. Only one "CE" or group of "CEs" can have use of the channel at any given time.

**N.B.:** This does not apply to items controlled under Category 3.

**Note 2:** "CEs" share memory if they access a common segment of solid state memory. This memory may include cache memory, main memory or other internal memory. Peripheral memory devices such as disk drives, tape drives or RAM disks are not included.

For Multiple "CEs" or groups of "CEs" not sharing memory, interconnected by one or more data channels:

$C_i = 0.75 * k_i$ (i = 2, ..., 32) (see Note below)  
$= 0.60 * k_i$ (i = 33, ..., 64)  

$= 0.45 * k_i$ (i = 65, ..., 256)  
$= 0.30 * k_i$ (i > 256)

The value of $C_i$ is based on the number of "CE"s, not the number of nodes.

where $k_i = \min \left( \frac{S_i}{K_r}, 1 \right)$, and

$K_r =$ normalizing factor of 20 MByte/s.  
$S_i =$ sum of the maximum data rates (in units of MByte/s) for all data channels connected to the i$^{th}$ "CE" or group of "CEs" sharing memory.

When calculating a $C_i$ for a group of "CEs", the number of the first "CE" in a group determines the proper limit for $C_i$. For example, in an aggregation of groups consisting of 3 "CEs" each, the 22nd group will contain "CE"$_{64}$, "CE"$_{65}$ and "CE"$_{66}$. The proper limit for $C_i$ for this group is 0.60.

Aggregation (of "CEs" or groups of "CEs") should be from the fastest-to-slowest; i.e.:  
TP$_1$ > TP$_2$ > .... > TP$_n$, and

in the case of TP$_1$ = TP$_{i+1}$, from the largest to smallest; i.e.:  
$C_i > C_{i+1}$

**Note:** The $k_i$ factor is not to be applied to "CEs" 2 to 12 if the TP$_i$ of the "CE" or group of "CEs" is more than 50 Mtops; i.e., $C_i$ for "CEs" 2 to 12 is 0.75.
